

ABSTRACT OF THE DISCLOSURE

The present invention relates to a method by which an end-user can collect and store information from the Internet, in particular from website addresses and can
5 transmit the information to other Internet end-users. The method also allows attribute-based modifications and the addition of information. The invention consists of selecting and packaging stored information that is to be distributed to other end-users. The
10 second end-user can then unpack the received information and process it in the same manner as the first end-user. The desired information that is of interest is stored in a hierarchy determined by the end-user.
